PROBLEM STATEMENT: Crowdsourced Civic Issue Reporting and Resolution System

PROBLEM STATEMENT

Urban local governments face a major “**visibility gap**” in civic issue management. Everyday problems like **potholes, broken streetlights, overflowing garbage bins, and water leaks** often remain unreported or unresolved due to inefficient reporting and tracking systems.

Key Challenges :

- **No Real-Time Reporting :**

Citizens lack a simple mobile platform to instantly report civic issues.

- **Manual Prioritization :**

Municipalities struggle to identify urgent problems, causing delays and inefficient resource allocation.

- **Lack of Transparency**

Citizens rarely receive status updates on complaints, reducing public trust.

- **Department Coordination Gaps**

Multiple departments (sanitation, public works, electricity) operate in silos, leading to slow resolutions.

SOLUTION

Proposed Solution

- ◆ AI-powered civic issue reporting platform with 4 portals.
- ◆ Citizens report with text/ audio/ photos/ videos + auto-location detection.
- ◆ AI image detection auto-classifies issues.
- ◆ Integrated chatbot for support & updates.
- ◆ Real-time map dashboard for transparency.
- ◆ **Four Portals:** Citizen, Municipality Dept, Government, NGO.

How It Addresses

- ◆ AI-driven sorting reduces delays & routes complaints.
- ◆ Chatbot ensures instant guidance for citizens.
- ◆ Four portals connect all stakeholders effectively.
- ◆ Real-time tracking builds trust & accountability.
- ◆ Empowers citizens & boosts government efficiency.

Innovation & Uniqueness

- ◆ AI image detection for automatic issue classification.
- ◆ Chatbot integration for interactive engagement.
- ◆ Multi-portal ecosystem ensures collaboration.
- ◆ AI-based sorting & prioritization of urgent issues.
- ◆ Data-driven insights for urban planning.

FLOW DIAGRAM

TECHNICAL REQUIREMENTS

NOVELTY / USE CASE

The Interactive Municipal Dashboard:

The primary novelty and core administrative value of our solution is the Interactive Municipal Dashboard. This is not just a data logging tool, but an automated triage and governance engine designed for city engineers:

Dynamic GIS Heatmapping:

All processed data is visualized on a live geographic map using geolocation data from both CCTV feeds and user uploads.

Density-Based Priority Zones:

The dashboard automatically clusters detected problems to visualize structural priority. Areas with a high density of severe issues are highlighted in Red (Immediate Action Required), areas with moderate damage or fewer issues are marked in Orange (Scheduled Maintenance), and minor wear is marked in Yellow (Monitoring).

Automated Workflow: Municipal engineers can click on a "Red Zone," review the aggregated visual evidence from citizens and CCTVs, and instantly generate a prioritized repair ticket for contractors.

BUSINESS MODEL / TARGET MARKET

Target Market :

- **Urban Local Bodies (ULBs):** Municipal corporations and local government departments.
- **Citizens:** Residents of urban and semi-urban areas reporting civic issues.
- **Smart City Projects:** Government initiatives using technology for urban management.
- **NGOs & Community Groups:** Organizations supporting civic welfare and environmental sustainability

Business Model :

- **B2G SaaS Model:** Subscription-based platform for municipalities to access dashboards, analytics, and automated issue routing.
- **Data Insights (DaaS):** Heatmaps and trend analysis to support urban planning and infrastructure management.
- **Operational Efficiency:** Helps governments reduce costs through automated prioritization and optimized resource allocation.
- **Tiered Access:** Free reporting for citizens; advanced analytics and integrations for government authorities.
